The client needed shade for the spa and aft decks on the yacht. The awnings needed to be light and fold small for storage. Matching top and rear deck awnings were crafted for the Super Yacht. Stainless tubes were designed, fabricated and reinforced with carbon fiber inner sleeves to support the awnings with easily detachable pulley systems. Massive tension was required to remain tight in all wind conditions.

Using stamoid SK light meant that our usual pre-gluing methods didn't work on the silicone. I had to modify and create new methods to use the product successfully. The stainless poles had to have extra support to cope with the huge tension, so we added carbon fiber inserts.

The client and crew were extremely satisfied with the ease of fitting, the finished look and storage size.
